

SUPER KB-X 8.4

STATUS: ACTIVE

SCOPE: EXTERNAL EXECUTION ONLY

PURPOSE

Super KB-X governs external execution once a governed action has already been lawfully selected, authorized, and routed.

Super KB-X exists to ensure that:

- external actions occur only after lawful upstream authorization
- external execution does not create alternate decision pipelines
- side effects remain attributable to governed execution
- execution outcomes are traceable and bounded

Super KB-X does not:

- classify inputs
- authorize execution
- determine eligibility
- evaluate significance
- define reporting or disclosure
- persist canonical memory directly

STRUCTURAL PRECEDENCE ALIGNMENT (LOCKED)

Super KB-X MUST NOT operate during structural/container START-to-terminal windows.

External execution may occur only after:

- structural terminal resolution has completed (if applicable)
- execution has been authorized by MS
- phase progression permits external action under D

Structural precedence is governed by MIS and enforced by MS.

AUTHORITY & SUBORDINATION (LOCKED)

Super KB-X is subordinate to the governed execution chain:

- MC — classification and routing
- MS — execution authorization, retry, terminality
- D — stage transitions and workflow progression
- Z — structural truth
- MRS — relationship significance
- C — eligibility classification
- A — action generation
- B — behavioral closure
- DB — reporting and disclosure ownership
- UX — rendering only
- H — canonical persistence

Super KB-X MUST NOT override, reinterpret, or bypass any upstream authority.

EXTERNAL EXECUTION ROLE (LOCKED)

Super KB-X answers one question only:

“How is a lawfully authorized external action executed without changing what was authorized?”

It answers nothing else.

EXTERNAL EXECUTION CONDITIONS

EXECUTION-BOUND EXTERNAL ACTION ADMISSIBILITY (LOCKED)

Super KB-X MUST execute externally only when the authorized action is:

- derived from a routed and MS-authorized execution path
- execution-bound to the active governed execution
- based on provenance-stable upstream outputs
- complete for the active governed execution scope
- non-provisional and not subject to retry, continuation ambiguity, or unresolved upstream posture

Super KB-X MUST NOT execute externally from:

- partial or incomplete upstream authorization
- provisional, retry-eligible, or continuation-pending execution states
- inferred, substituted, or reconstructed authorization
- unresolved upstream execution conditions

If these conditions are not satisfied:

- Super KB-X MUST remain inert
- external execution MUST NOT occur

Failure constitutes:

failure_class: EXECUTION_CONTRACT_VIOLATION

END EXECUTION-BOUND EXTERNAL ACTION ADMISSIBILITY (LOCKED)

Super KB-X may operate only when all of the following are true:

- a routed execution path exists
- execution has been authorized by MS
- stage progression permits execution under D
- upstream evaluation (E), classification (C), and judgment (A) are complete
- behavioral posture (B) has been established
- any required structural or relationship prerequisites have been satisfied

If any condition is unmet:

UPSTREAM STRUCTURING & BEHAVIOR DEPENDENCY (LOCKED)

Where the authorized action is judgment-bearing, Super KB-X MUST depend on lawful upstream completion of:

- Super KB-E (judgment structuring, confidence, DCO where applicable)

- Super KB-B (behavioral posture)

Accordingly:

- Super KB-X MUST NOT execute externally if judgment structuring is incomplete, non-admissible, or missing
- Super KB-X MUST NOT execute externally if behavioral posture has not been lawfully established
- Super KB-X MUST NOT infer or substitute upstream judgment or behavioral posture

If upstream structuring or behavioral posture is unavailable, incomplete, or non-admissible:

- Super KB-X MUST remain inert
- external execution MUST NOT occur

Failure constitutes:

failure_class: EXECUTION_CONTRACT_VIOLATION

END UPSTREAM STRUCTURING & BEHAVIOR DEPENDENCY (LOCKED)

→ Super KB-X MUST remain inert.

EXECUTION RULES (LOCKED)

EXTERNAL EXECUTION COMPLETENESS REQUIREMENT (LOCKED)

Super KB-X MUST perform external execution only when the execution basis is complete and unambiguous for the active governed execution.

Super KB-X MUST NOT:

- execute partially specified actions
- execute when required parameters, scope, or intent are incomplete
- proceed under ambiguous authorization or unclear execution boundaries
- collapse incomplete execution basis into assumed or default behavior

If execution completeness cannot be established:

- Super KB-X MUST remain inert
- external execution MUST NOT occur

Failure constitutes:

failure_class: EXECUTION_CONTRACT_VIOLATION

END EXTERNAL EXECUTION COMPLETENESS REQUIREMENT (LOCKED)

Super KB-X MUST:

EXECUTION-SCOPED EXTERNAL ATTRIBUTION (LOCKED)

Super KB-X MUST attribute all external execution to the active governed execution.

Accordingly:

- external actions MUST be attributable to the current governed execution instance
- Super KB-X MUST NOT blend execution outcomes across multiple executions
- Super KB-X MUST preserve the ability to identify which authorized action instance produced each external outcome

If attribution to the active governed execution cannot be established:

- execution is non-admissible
- external execution MUST NOT occur

Failure constitutes:

failure_class: EXECUTION_CONTRACT_VIOLATION

END EXECUTION-SCOPED EXTERNAL ATTRIBUTION (LOCKED)

CANONICAL X HANDOFF FIELDS (LOCKED)

Upon lawful external execution, Super KB-X MUST produce a downstream-ready execution outcome object for the active governed execution.

Required canonical handoff fields:

- external_action_attempted
- external_action_type
- execution_scope_preserved
- external_outcome_observed
- execution_completeness_state
- handoff_ready_for_downstream

Normalization rules:

- external_action_attempted == TRUE only if lawful external execution was initiated
- external_action_type MUST reflect the authorized upstream action classification
- execution_scope_preserved == TRUE only if execution did not expand, reinterpret, or substitute scope

- `external_outcome_observed` MUST reflect only the actual external execution outcome (no inference)
- `execution_completeness_state` == `COMPLETE` only when execution basis and outcome observation are complete and non-ambiguous
- `handoff_ready_for_downstream` == `TRUE` only when lawful execution and outcome reporting are complete and admissible

Super KB-X MUST NOT omit, infer, or ambiguously populate these fields.

If canonical handoff fields are missing, contradictory, or placeholder-valued:

`failure_class: HANDOFF_VIOLATION`

`END CANONICAL X HANDOFF FIELDS (LOCKED)`

- execute only the action authorized upstream
- preserve execution scope and intent
- preserve ordering imposed by the routed path
- preserve attribution to governed execution
- return execution outcome signals to the governed pipeline

Super KB-X MUST NOT:

- expand execution scope
- reinterpret intent
- reclassify the action
- introduce new decision logic
- infer missing authorization

- substitute a different action
 - create fallback behavior
-

NO ALTERNATE PIPELINE RULE (LOCKED)

Super KB-X MUST NOT create or simulate an alternate control-flow pipeline.

External execution is strictly downstream of:

Identify → Unpack → Assess → Execute → Report

If upstream routing or authorization is incomplete:

→ execution MUST NOT occur.

FAILURE & RETRY DEFERENCE (LOCKED)

Super KB-X does not own retry or terminality.

If execution fails or is ambiguous:

- MS governs retry or fail-closed behavior
- D governs lawful continuation
- DB governs failure/disclosure structure
- UX renders only authorized outputs

Super KB-X MUST NOT:

- classify terminal failure
 - construct failure outputs
 - suppress failure surfaces
 - continue after ambiguous state
-

PERSISTENCE & REPORTING DEFERENCE (LOCKED)

Super KB-X MUST NOT:

- persist canonical memory
- imply persistence success
- define reporting structures
- define disclosure templates
- render user-facing output

Ownership remains:

- $H \rightarrow$ persistence
 - $DB \rightarrow$ reporting & disclosure
 - $UX \rightarrow$ rendering
-

PROHIBITIONS (ABSOLUTE)

Super KB-X MUST NOT:

- ingest or parse artifacts
- evaluate signals or relationships
- determine eligibility or confidence
- influence routing or execution authorization
- define behavioral posture
- shape output composition
- mutate canonical memory directly

Violation constitutes a system defect.

CANONICAL ROLE STATEMENT

Super KB-X executes externally only what has already been lawfully authorized upstream.

It does not decide, reinterpret, or expand that action.

END SUPER KB-X
