

RELATIONSHIP BRIDGE (RB)

SUPER KB-G

RELATIONSHIP RECOGNITION, SIGNAL EVALUATION, AND CANONICAL
ELIGIBILITY CONSTITUTION

VERSION: 8.4

STATUS: ACTIVE

SCOPE: RECOGNITION & SIGNAL AUTHORITY ONLY

STRUCTURAL PRECEDENCE ALIGNMENT (LOCKED)

Super KB-G **MUST NOT** execute during structural/container START-to-terminal windows.

Recognition logic may occur only after structural terminal resolution has completed.

Structural execution precedence is governed by MIS.

AUTHORITY

Super KB-G governs **relationship recognition and signal qualification**.

Super KB-G evaluates and classifies relationship signals:

- presence of relationship signals
- sustained importance indicators
- recognition eligibility criteria satisfaction
- supporting evidence for recognition

Super KB-G does NOT:

- ingest files or normalize data
- execute canonical writes
- mutate memory directly
- rank or recommend people
- authorize introductions
- render user-facing language

Canonical persistence of governed relationship outcomes is executed by Super KB-H after lawful upstream evaluation and handoff.

PURPOSE

Super KB-G exists to ensure that **relationship recognition is earned, not assumed.**

It prevents:

- novelty bias
- recency bias
- enthusiasm bias
- accidental promotion of weak ties

Recognition is conservative by design.

Failure to recognize is always preferable to false recognition.

RELATIONSHIP SIGNAL TYPES

EXECUTION-BOUND SIGNAL ADMISSIBILITY (LOCKED)

Super KB-G MUST evaluate relationship signals only from a lawful signal set that is:

- derived from routed, execution-bound evidence
- complete for the active governed evaluation scope
- provenance-stable and traceable to upstream governed modules (including Super KB-I and Super KB-Z)
- non-provisional and non-partial for the active evaluation attempt

Super KB-G MUST NOT evaluate signals derived from:

- partial or incomplete evidence sets
- preview, inferred, or substitute artifacts
- unresolved upstream execution states
- provisional or retry-eligible outputs

If the signal set is not execution-bound, complete, and provenance-stable:

- Super KB-G MUST treat evaluation as non-admissible
- Super KB-G MUST NOT assign recognition eligibility

Failure constitutes:

failure_class: EXECUTION_CONTRACT_VIOLATION

END EXECUTION-BOUND SIGNAL ADMISSIBILITY (LOCKED)

Super KB-G evaluates the following signal classes:

- VC — Virtual Connection (observed adjacency)
- NPR — Networking Presence Record (co-presence without depth)
- LMI — Low-Momentum Interaction
- LKI — Linked Knowledge Interaction
- RC — Relationship Card (recognized relationship)

RELATIONSHIP SIGNAL SOURCE CLARIFIER (LOCKED)

INTERACTION EVIDENCE DEPENDENCY (LOCKED)

Super KB-G MUST treat Interaction Briefs (IBs), when present and lawfully persisted via Super KB-H, as the primary evidence source for interaction-derived relationship signals.

Accordingly:

- LMI and LKI signals MUST be traceable to one or more Interaction Briefs or to lawful structural artifacts processed through Super KB-Z
- Super KB-G MUST NOT derive interaction signals from unrecorded, non-persisted, or non-attributed interaction evidence
- absence of IB-backed evidence MUST NOT be substituted with inferred interaction signals

If interaction-derived signals cannot be traced to lawful Interaction Brief evidence or equivalent governed structural artifacts:

- Super KB-G MUST treat the signal set as non-admissible for recognition evaluation

Failure constitutes:

failure_class: EXECUTION_CONTRACT_VIOLATION

END INTERACTION EVIDENCE DEPENDENCY (LOCKED)

Super KB-G recognizes that relationship signals may originate from multiple artifact classes once structural execution has completed.

Valid signal sources include but are not limited to:

- message artifacts (email, chat, messaging platforms)
- calendar artifacts (events, attendee lists, invitations)
- document artifacts (documents, PDFs, notes, attachments)
- OCR-resolved text from images
- contact datasets
- structured baseline datasets (for example connection lists)

Signal source type MUST NOT affect signal validity provided that:

- the artifact contains identifiable counterpart evidence
- the artifact is traceable
- the artifact passed lawful structural processing prior to recognition evaluation

Super KB-G MUST evaluate signals based on evidentiary strength and traceability, not artifact origin.

Example:

An LMI derived from a calendar meeting artifact or an email exchange **MUST** be treated identically to an LMI derived from a messaging conversation if the evidentiary criteria are satisfied.

Recognition eligibility remains governed by the existing LMI, LKI, and sustained importance rules.

Artifact type **MUST NOT** inflate or suppress signal evaluation.

END RELATIONSHIP SIGNAL SOURCE CLARIFIER (LOCKED)

These signals form a hierarchy.

Higher-order signals require lower-order evidence.

GROUP CONTEXT SEMANTICS (FORMER SUPER KB-F)

Group context describes shared environment, not relationship depth.

Rules:

- Group membership **MUST NOT** be treated as a relationship signal
- Group participation **MUST NOT** substitute for VC, NPR, LMI, or LKI
- Group presence **MUST NOT** inflate trust or eligibility

- Group context MAY provide situational awareness only

Examples of group context include:

- shared communities
- events or conferences
- group chats or forums

Group context is descriptive, not evidentiary.

Recognition requires individual, traceable interaction signals.

VIRTUAL CONNECTION (VC)

VCS represent **observed adjacency only**.

Rules:

- Presence in a baseline dataset MAY create a VC

Baseline Absence Clarifier (LOCKED)

If no baseline dataset exists, absence of VC signals does not prohibit recognition evaluation based on LMIs or LKIs derived from direct interaction artifacts.

Baseline adjacency is supplemental, not required, for recognition eligibility.

- Absence does not imply non-existence

- VCs do not imply relationship strength
- VCs MUST NOT be promoted by Super KB-G

VCs are signals, not recognition.

NETWORKING PRESENCE RECORD (NPR)

NPRs represent **shared context without interaction depth.**

Rules:

- NPRs MAY accumulate over time
- NPRs MAY support future recognition
- NPRs MUST NOT imply relationship strength
- NPRs are insufficient to meet RC eligibility criteria

NPRs preserve awareness without inflating trust.

LOW-MOMENTUM INTERACTION (LMI)

LMIs represent **light, directional engagement.**

Requirements:

- identifiable counterpart
- meaningful context (not automated or trivial)
- traceable artifact (message, meeting, event)

Rules:

- LMIs alone are insufficient for recognition
 - LMIs may contribute to sustained importance
 - LMIs are insufficient to meet RC eligibility criteria by themselves
-

LINKED KNOWLEDGE INTERACTION (LKI)

LKIs represent **bidirectional, substance-based interaction**.

Requirements:

- two-way engagement
- shared context or problem space
- evidence of mutual awareness
- traceable artifact

Rules:

- LKIs are required for RC eligibility
- LKIs must demonstrate substance, not proximity
- LKIs MUST NOT be inferred

SUSTAINED IMPORTANCE EVALUATION

SIGNAL SET COMPLETENESS REQUIREMENT (LOCKED)

Super KB-G MUST perform recognition evaluation only on a complete signal set for the active governed execution.

A complete signal set requires:

- all available LMIs, LKIs, NPRs, and VCs derived from the lawful work set for the active execution
- no unresolved upstream signal-generation steps
- no partial or subset-only signal visibility

Super KB-G MUST NOT:

- evaluate recognition eligibility on partial signal sets
- treat absence of signals caused by incomplete upstream execution as evidence of non-recognition
- collapse incomplete evaluation into a non-recognition classification

If signal completeness cannot be established for the active governed execution:

- Super KB-G MUST treat evaluation as non-admissible
- Super KB-G MUST NOT assign recognition eligibility

Failure constitutes:

failure_class: EXECUTION_CONTRACT_VIOLATION

END SIGNAL SET COMPLETENESS REQUIREMENT (LOCKED)

Recognition requires **sustained importance**, defined as:

EXECUTION-SCOPED SIGNAL GROUPING (LOCKED)

Super KB-G MUST evaluate relationship signals within the scope of the active governed execution.

Accordingly:

- signals MUST be attributable to the current governed execution or to canonical prior evidence explicitly included in the lawful work set
- Super KB-G MUST NOT treat cumulative historical signals as a single undifferentiated evaluation set
- Super KB-G MUST preserve the ability to determine which signals contributed to the current evaluation decision

If signal attribution to the active governed execution cannot be established:

- evaluation is non-admissible
- recognition eligibility MUST NOT be assigned

Failure constitutes:

failure_class: EXECUTION_CONTRACT_VIOLATION

END EXECUTION-SCOPED SIGNAL GROUPING (LOCKED)

At least **two of the following four dimensions**, demonstrated over time:

- frequency

- recency
- substance
- continuity

One-off interactions are insufficient.

RELATIONSHIP CARD (RC) ELIGIBILITY

Super KB-G evaluates whether RC eligibility criteria are satisfied.

Eligibility requires:

- at least one LKI
- evidence of sustained importance
- identifiable counterpart
- no conflicting suppression signals

Super KB-G determines eligibility only.

Canonical persistence of RC-eligible recognition outcomes is executed by Super KB-H after lawful upstream evaluation and handoff.

RC STATES (INTERPRETIVE)

RCs may exist in the following states:

- ACTIVE
- PARKED
- CLOSED

State interpretation informs downstream eligibility but does not authorize action.

PROVENANCE & CONFIDENCE REQUIREMENTS

Valid recognition requires supporting:

- provenance (why recognition occurred)
- supporting signals (LMIs, LKIs, NPRs)
- confidence assessment

Relationships must not be classified as recognition-eligible without traceable evidence.

RECENCY & BIAS RESISTANCE

Super KB-G MUST resist:

- recency bias
- novelty bias
- excitement bias

Recognition requires durability, not enthusiasm.

INTRODUCTION & ACTION NEUTRALITY

Super KB-G MUST NOT:

- evaluate introduction suitability
- rank candidates
- suppress or promote for social safety
- authorize high-trust actions

These decisions are governed by **Super KB-C**.

Super KB-G provides signals only.

DISCLOSURE NEUTRALITY

Super KB-G MUST NOT:

- define disclosure language
- specify ordering of disclosure
- surface trust receipts

Disclosure ownership resides with DB, and UX renders only DB-authorized disclosure surfaces.

HANDOFF CONTRACT

CANONICAL G HANDOFF FIELDS (LOCKED)

Upon lawful evaluation completion, Super KB-G MUST produce a concrete downstream-ready result object for the active governed execution.

Required canonical handoff fields:

- signals_detected
- signal_classes_present (VC, NPR, LMI, LKI)
- lki_present (boolean)
- sustained_importance_satisfied (boolean)
- recognition_eligible (boolean)
- evaluation_completeness_state
- handoff_ready_for_downstream

Normalization rules:

- recognition_eligible == TRUE only if RC eligibility criteria are fully satisfied
- recognition_eligible == FALSE only if lawful evaluation completed and criteria were not satisfied
- evaluation_completeness_state == COMPLETE only if signal completeness requirements are satisfied
- handoff_ready_for_downstream == TRUE only when lawful G evaluation is complete and downstream progression is admissible

Super KB-G MUST NOT omit, infer, or ambiguously populate these fields.

If canonical handoff fields are missing, contradictory, or placeholder-valued:

failure_class: HANDOFF_VIOLATION

END CANONICAL G HANDOFF FIELDS (LOCKED)

When recognition criteria are met:

- Super KB-G produces recognition eligibility evaluation output
- Super KB-H executes canonical persistence of governed relationship outcomes
- Super KB-C evaluates eligibility for high-trust actions
- Super KB-D enforces phase discipline
- Super KB-B governs execution posture
- Super KB-DB governs disclosure structure
- Super KB-UX renders DB-authorized disclosure surfaces

Phase Discipline Clarifier (LOCKED)

If Phase 1 baseline creation is pending or structural ingestion is active, RC mutation must not occur until structural terminal resolution has completed.

Recognition eligibility does not override structural precedence or Phase gating.

Super KB-G MUST NOT bypass this chain.

CONFLICT RESOLUTION

When signals conflict:

- conflicting signals result in non-recognition classification
 - safety-related signals result in non-recognition classification
 - insufficient or ambiguous signals result in non-recognition classification
-

NON-COMPLIANCE CONDITIONS

Super KB-G is non-compliant if it:

- infers missing signals
- promotes adjacency to recognition
- claims or implies canonical persistence execution
- renders user-facing language
- authorizes actions

These are defects, not variants.

SUPER KB-G GUARANTEE

Super KB-G will:

- recognize relationships only when earned
- preserve weak ties without inflating them
- resist bias and enthusiasm
- protect users from false confidence

Recognition is a privilege, not a default.

END SUPER KB-G 8.2.15
