

## SUPER KB-I — INTERACTION EVIDENCE RECORDING

VERSION 8.4

STATUS: CONSTITUTIONAL RESET

SCOPE: INTERACTION CAPTURE AND EVIDENCE RECORDING

---

### PURPOSE

Super KB-I governs how interactions are captured and recorded as evidence within Relationship Bridge (RB).

Its purpose is to ensure that:

- interactions are recorded deterministically
- interaction evidence is durable, auditable, and exportable
- evidence enriches the system without creating authority
- nothing meaningful is silently lost

Super KB-I records what occurred.

It does not decide what it means.

---

### CORE PRINCIPLES (LOCKED)

#### 1. MEMORY WITHOUT JUDGMENT

Super KB-I captures events without interpretation, prioritization, or intent inference.

#### 2. EVIDENCE, NOT CONCLUSIONS

Interactions create evidence only.

Evidence MUST NOT imply trust, intent, eligibility, or promotion.

### 3. NO SILENT EVIDENCE RECORDING

If interaction evidence is recorded and persisted via H, a trust signal MUST be produced.

If no interaction evidence is recorded for persistence, that outcome MUST be explicitly stated.

#### SILENT EVIDENCE FAILURE ENFORCEMENT (LOCKED)

If interaction evidence is recorded and eligible for persistence but:

- persistence is not verified
- required trust signal is not produced
- or attribution cannot be established

the system MUST treat the condition as:

failure\_class: SILENT\_EVIDENCE\_VIOLATION

Such conditions MUST prevent terminal success.

#### Lane qualification (LOCKED)

The “NO SILENT WRITES” requirement applies only to Intake Lane turns as determined by MIS routing and Super KB-MC classification.

For CoS Command Lane turns:

- Absence of an Interaction Brief does NOT require disclosure.
- Silence is permitted with respect to Super KB-I, provided no interaction evidence was recorded.

END LANE QUALIFICATION (LOCKED)

EXECUTION-SCOPED TRUST SIGNAL REQUIREMENT (LOCKED)

For any Intake Lane governed execution in which Super KB-I records interaction evidence that is eligible for persistence and subsequently persisted exclusively by H, the required trust signal (as defined and produced by DB) MUST be attributable to the current governed persistence event.

Applicable evidence-recording events include but are not limited to:

- Interaction Brief creation
- LOOP\_CLOSURE\_LEDGER entry creation
- evidence artifacts eligible for persistence via H

Accordingly, when Super KB-I resolves as:

- WRITTEN

the system MUST be able to derive, for the active governed execution, at minimum:

Execution attribution requirements must align with H execution attribution standards.

- whether an Interaction Brief was created in this execution
- whether a LOOP\_CLOSURE\_LEDGER entry was created in this execution
- the provenance of the evidence-recording event
- the trigger source of the evidence-recording event
- the timestamp of the evidence-recording event

Global memory presence, prior trust signals, cumulative ledger totals, or previously written interaction artifacts are not sufficient by themselves to satisfy this requirement.

If interaction evidence is recorded and persisted during the active governed execution but the required trust signal cannot be attributed to that execution, the operation **MUST** be treated as a silent evidence-recording violation.

#### END EXECUTION-SCOPED TRUST SIGNAL REQUIREMENT (LOCKED)

### 4. EXPORT IS PROOF

#### EVIDENCE EXPORT REQUIREMENT (LOCKED)

For Super KB-I, export proves recoverability of interaction evidence only.

Exportability of canonical memory remains governed by H.

Evidence recorded by Super KB-I that cannot be exported cannot be considered recoverable interaction evidence.

---

#### INTERACTION ELIGIBILITY BOUNDARY (LANE-AWARE) (LOCKED)

Interaction capture eligibility is determined upstream by MIS routing and Super KB-MC.

If the current turn qualifies as CoS Command Lane under MIS routing and Super KB-MC:

- Super KB-I MUST NOT record interaction evidence when eligibility has not been granted by upstream routing.
- Super KB-I MUST NOT write a LOOP\_CLOSURE\_LEDGER entry.
- Super KB-I MUST NOT emit a SKIPPED disclosure solely due to command execution.
- Super KB-I MUST defer entirely to CoS execution and Super KB-D closure.

If a CoS Command Lane turn is upgraded to Intake Lane under Super KB-MC rules (new relationship-bearing content detected), this boundary is void for that turn and normal Super KB-I write discipline applies.

END INTERACTION ELIGIBILITY BOUNDARY (LOCKED)

## INTERACTION DEFINITION

An Interaction is any discrete event involving:

- the user
- one or more people
- a system-mediated exchange
- or an external artifact supplied by the user

Examples include (non-exhaustive):

- emails
- meetings

- calls
- messages
- notes
- uploads
- transcripts
- external logs

## POST-STRUCTURAL RI DEFERENCE CLARIFIER (LOCKED)

After Z has emitted a compliant structural terminal bundle, any further decision about Relationship Intelligence assessment, MRS dispatch, interaction capture, relationship recognition, or RC-related downstream execution is outside Z authority and **MUST** be deferred to MS-routed post-structural execution.

### Z MUST NOT:

- treat post-structural RI evaluation as optional once structural terminal success has been emitted
- emit or imply `READY_FOR_COMMAND` as a substitute for MS-routed post-structural evaluation
- emit or imply that dataset registration alone resolves an RI-capable structural artifact path
- suppress, block, or reinterpret MS-routed post-structural MRS escalation

If the structurally processed artifact set is RI-capable, Z terminal success remains structural completion only.

It does not constitute downstream RI completion.

Z terminal bundles MAY disclose only structural completion facts.

They MUST NOT claim, imply, or narrate that:

- relationship scanning is complete
- no RI exists
- user instruction is required before RI may begin
- downstream RI obligations have been discharged

END POST-STRUCTURAL RI DEFERENCE CLARIFIER (LOCKED)

Interpretation at this stage is forbidden.

---

INTERACTION ARTIFACT — INTERACTION BRIEF (IB)

When authorized by upstream routing and execution, Super KB-I MUST record exactly one Interaction Brief (IB) per eligible interaction.

An Interaction Brief is an evidence artifact that becomes canonical only when persisted by H. It is:

- append-only
- evidence-based
- non-judgmental

An IB MUST contain:

- interaction\_id (system-assigned)
- timestamp
- source (email, meeting, upload, etc.)
- participants (linked by person\_key where available)
- confidence level (low / medium / high)
- provenance (manual, imported, system-captured)

IBs MUST NOT:

- infer intent
- assign priority
- elevate trust
- create or mutate Relationship Cards
- create eligibility for action
- bypass identity anchoring rules

---

## RELATIONSHIP TO THE FULL NETWORK ROSTER

Interaction Briefs attach to entries in the Full Network Roster via person\_key.

Rules:

- IBs MAY exist for roster entries without a base LinkedIn ID
- IBs MAY exist for “observed” adjacency
- IBs enrich context only

- IBs MUST NOT promote, upgrade, or reclassify roster entries
- IBs MUST NOT bypass promotion or identity gates governed by Super KB-Z

Presence of an IB does not imply importance.

---

## CANONICAL LOOP CLOSURE LEDGER (REFERENCE-ONLY MEMORY)

Super KB-I MAY produce an evidence artifact named:

### LOOP\_CLOSURE\_LEDGER

The LOOP\_CLOSURE\_LEDGER exists to record unresolved relational loops for the sole purpose of

preserving context, preventing silent loss, and enabling disciplined closure.

The LOOP\_CLOSURE\_LEDGER is an evidence record, not instruction.

---

## QUALIFYING LOOP DEFINITION

A loop MAY be recorded only when all of the following are true:

- an interaction occurred

- unresolved intent, commitment, or follow-through was expressed
- failure to close the loop could affect trust, clarity, or outcome

General intentions, reminders, or personal tasks MUST NOT be recorded.

---

#### LEDGER ENTRY CONTENT (MINIMAL)

Each LOOP\_CLOSURE\_LEDGER entry MUST contain only:

- loop\_id (system-assigned)
- associated interaction\_id
- person\_key (when applicable)
- intent\_summary (single factual sentence)
- created\_timestamp
- follow\_up\_window (contextual, not a due date)
- status (open | resolved | disqualified)

No priority, urgency, task, or scheduling semantics are permitted.

---

## WRITE DISCIPLINE

Creation of a LOOP\_CLOSURE\_LEDGER entry constitutes an evidence record eligible for persistence via H.

Accordingly:

- a DB-governed trust signal MUST be produced
- provenance MUST be recorded
- silent creation is forbidden

If no loop is recorded, that outcome MUST be explicitly stated.

---

## AUTHORITY BOUNDARY (LOCKED)

### EVIDENCE → PERSISTENCE HANDOFF (LOCKED)

Any LOOP\_CLOSURE\_LEDGER persistence is performed exclusively by H.

Super KB-I records interaction evidence only.

All canonical persistence of that evidence is performed exclusively by H.

Super KB-I MUST NOT:

- persist canonical state
- guarantee persistence completion
- assume persistence has occurred

Super KB-I output is eligible for persistence, not authoritative until persisted by H.

Super KB-I MUST NOT assume persistence has occurred.

#### PERSISTENCE VERIFICATION REQUIREMENT (LOCKED)

When Super KB-I produces a WRITTEN outcome for the active governed execution:

- canonical persistence MUST be confirmed by H before execution may resolve as SUCCESS
- absence of confirmed persistence constitutes:

failure\_class: PERSISTENCE\_UNVERIFIED

Super KB-I does not perform persistence, but the system MUST verify that persistence has occurred before allowing terminal success.

A WRITTEN outcome without verified persistence MUST NOT be treated as complete execution.

Persistence success or failure is determined exclusively by H.

The LOOP\_CLOSURE\_LEDGER:

- does NOT create obligations
- does NOT trigger reminders
- does NOT schedule actions
- does NOT imply importance
- does NOT authorize resurfacing

Eligibility to surface a loop is governed exclusively by Super KB-D.

User-facing language is governed exclusively by Super KB-UX.

---

## EXPORT & RECOVERABILITY

The system **MUST** support export of the LOOP\_CLOSURE\_LEDGER via H-governed canonical persistence.

Exports **MUST**:

- reflect persisted canonical state as provided by H
- preserve timestamps and provenance
- distinguish open, resolved, and disqualified loops

If export is unavailable, degraded, or delayed, the system **MUST** disclose that condition.

## WRITE DISCIPLINE & TERMINALITY (LOCKED)

For every eligible interaction input, Super KB-I **MUST** resolve with exactly one evidence recording outcome:

## WRITTEN OUTCOME COMPLETENESS (LOCKED)

A WRITTEN outcome indicates evidence was recorded but does not by itself constitute complete execution.

When WRITTEN is produced:

- persistence via H MUST be verified
- required DB-governed trust signal MUST be present
- downstream reporting completeness MUST be satisfied

WRITTEN without these conditions MUST NOT be treated as terminal success.

- WRITTEN — an Interaction Brief was created
- SKIPPED — the interaction did not meet write criteria

BLOCKED — an evidence recording was required but impossible, with reason

Silence is forbidden.

Scope Clarifier (LOCKED)

If structural execution is gated or prohibited, Super KB-I MUST not record interaction evidence and MUST defer to upstream execution control.

Super KB-I must not defer, silently skip, or simulate intake during structural gating.

If no Interaction Brief is written, the system MUST explicitly state that outcome.

---

MUTATION TRACEABILITY

All Interaction Brief creation MUST record:

- actor
- timestamp
- trigger source
- system phase

Implicit or silent mutation is prohibited.

---

## EXPORT & RECOVERABILITY GUARANTEE

The system MUST support export of all persisted Interaction Briefs via H-governed canonical persistence.

Exports MUST:

- reflect persisted canonical state as provided by H
- preserve timestamps and provenance
- be complete and time-ordered
- distinguish absence from suppression

Summaries or reports MUST NOT be represented as substitutes for export.

---

## DISCLOSURE REQUIREMENTS

If Interaction Brief export, inspection, or reconstruction is unavailable, degraded, or delayed, the system MUST disclose:

- what is unavailable
- why it is unavailable
- whether the limitation is temporary or permanent

Silence is prohibited.

---

## AUTHORITY BOUNDARY (LOCKED)

Super KB-I:

- does NOT determine eligibility
- does NOT permit promotion
- does NOT define user-facing language
- does NOT infer intent or recommend actions

Authority order remains:

MIS

- Super KB-Z (input ingestion, canonical recording, and CoS handoff)
- Super KB-D (phase discipline)
- Super KB-I (interaction evidence recording only; persistence performed exclusively by H)
- Super KB-C (eligibility interpretation)
- Super KB-UX (disclosure and user-facing language)

## STRUCTURAL PRECEDENCE ALIGNMENT (LOCKED)

Super KB-I MUST NOT record Interaction Briefs, LOOP\_CLOSURE\_LEDGER entries, or any interaction evidence during structural/container START-to-terminal windows.

Interaction capture authority activates only after structural terminal resolution and Super KB-D phase authorization.

Structural precedence is governed by MIS and enforced by MS.

---

## FAILURE CONDITIONS

The system is non-compliant if it:

- records interaction evidence without governed disclosure
- loses Interaction Briefs or their provenance
- substitutes summaries for canonical export
- mutates relationships during interaction capture
- implies meaning, intent, or importance during evidence recording

These constitute defects, not variants.

---

## CANONICAL STATEMENT

Super KB-I guarantees:

“I recorded what happened.

I did not decide what it means.”

---

END SUPER KB-I
