

PRODUCT PORTFOLIO MAP

Genius restaurant technology

McDonald's routing reference

DRAFT FOR RYAN HILDEBRAND CONFIRMATION — NOT FOR EXTERNAL DISTRIBUTION
This map translates public Genius capabilities and former Xenial/RTI labels into a practical routing aid for Jeff Coffland. Items labeled “Ryan to confirm” must be resolved before Todd sends an external version.

Prepared for	Ryan Hildebrand — product and delivery confirmation
Intended next recipient	Jeff Coffland — internal McDonald's routing
As of	August 12, 2026
Basis	Official Global Payments/Xenial materials + internal product and payments inputs

Positioning guardrails

- This is a portfolio and routing map, not a proposal to replace NEWPOS or an assertion that McDonald's has opened a formal second-source process.
- CosMc's is prior-fit evidence. It is not represented here as a McDonald's system approval or a production entitlement.
- Michael Schwartz confirmed Global Payments owns the hardware design/specification and Flytech manufactures it; exact SKUs, certifications, service coverage and permission to name Flytech externally still require confirmation.
- Roadmap concepts discussed on the JPR call are excluded from the supported-capability column until Product confirms availability.

Ryan's confirmation agenda

The fastest useful review

Resolve the decisions below first. Once these are answered, the external map can be simplified to current names, proven capabilities, deployment context and the right internal owner for Jeff.

#	Decision needed	Ryan response / owner
1	Genius hardware: confirm exact sellable models/SKUs, supported operating systems, payment certifications, availability by country, lifecycle and field replacement model. Michael Schwartz confirmed Global Payments designs and owns the specification and Flytech manufactures it.	
2	Current naming: confirm the external label and former Xenial/RTI lineage for Enterprise POS, Kiosk, Kitchen, Digital Displays, Drive Thru and Back Office.	
3	CosMc's footprint: identify exactly which products, hardware, integrations and support model were deployed, and what may be named externally.	
4	Product versus roadmap: confirm which drive-thru camera/timer, OCU, reporting and display configurations are commercially available today.	
5	Customer proof: approve any usable references, metrics and brand names—especially A&W Canada and Yoshinoya—and identify stronger McDonald's-relevant references.	
6	Delivery coverage: confirm installation, monitoring, help desk, depot/field service, international support and internal owner for each category.	
7	Payments: validate the distilled GPI/Portico entry—current names and lineage, Global Payments versus Worldpay roles, supported processors and markets, certified devices, and unattended-payment status.	

How the map is organized

- Publicly grounded: the capability is supported by current Global Payments or Xenial materials.
- Internal claim — verify: useful JPR or account context that cannot yet be repeated externally as fact.
- Lineage: a working translation between today's Genius language and labels Jeff may know from Xenial, RTI or CosMc's.

Core commerce and in-store hardware

Genius Enterprise POS PUBLICLY GROUNDED

Current label	Genius Enterprise POS
Lineage	Working lineage: Xenial enterprise POS / Xenial Ordering. Confirm the exact product-to-product mapping.
What is supported	Native cloud enterprise POS with centralized management, real-time synchronization and offline operation. Public materials describe support across iOS, Android, Windows and Linux, with counter, kiosk, curbside and drive-thru use cases and customer-owned or Global Payments-supplied hardware.
McDonald's relevance	Relevant as an integration and restaurant-commerce platform reference. Do not position it as a proposed NEWPOS replacement without an explicit McDonald's request.
Proof point	Global Payments cites A&W Canada across 1,032+ restaurants, rolled out in under three years.
Ryan to confirm	Current sellable edition/SKU; exact Xenial lineage; supported markets and service model; reference permission; what POS software and version CosMc's used.

Genius hardware PUBLICLY GROUNDED

Current label	Genius countertop and Genius handheld hardware (public category labels; model names not established)
Lineage	Working lineage: Xenial POS hardware / portable tablets / rugged terminals. Hardware identity may differ by Genius edition and geography.
What is supported	Global Payments designs and owns the core Genius hardware specification; Flytech is the manufacturing partner. Michael Schwartz confirmed it is not an off-the-shelf Flytech product. The payments deck separately lists Verifone payment terminals and an iMin-based Genius All In One tablet; those device families should not be conflated with the Flytech-manufactured POS line.
McDonald's relevance	Potentially important for store-standard discussions, but only after the hardware bill of materials, payment components, certifications, service model and deployment ownership are clear.
Proof point	Confirmed internally: Global Payments-designed and -owned specification, manufactured by Flytech, with a hardware lineage extending back to SICOM.
Ryan to confirm	Exact models/SKUs; which products are GP-designed/Flytech-manufactured versus Verifone or iMin-based; OS and processor options; payment certification; country availability; lifecycle; field service; CosMc's configuration; permission to name manufacturers externally.

Genius Kiosk PUBLICLY GROUNDED

Current label	Genius Kiosk / enterprise self-service ordering
Lineage	Former public label: Xenial Kiosk hardware and software / Xenial Ordering Kiosk.
What is supported	Self-service ordering software with indoor/outdoor and multiple mounting options described in Xenial materials; peripherals can include printers, scanners, PIN pads/payment devices, cameras and Wi-Fi. The enterprise platform supports kiosk as an order channel.
McDonald's relevance	Relevant where McDonald's wants modular self-service or integration options, subject to global store standards and accessibility requirements.
Proof point	Xenial public materials describe hardware plus software and an SDK path for mixed-vendor kiosk/POS environments.
Ryan to confirm	Current external name and sellable configurations; enclosure/hardware vendors; accessibility and security certifications; supported payments; CosMc's use; international install/service coverage.

Kitchen, back office and payments

Genius Kitchen PUBLICLY GROUNDED

Current label	Genius Kitchen / Kitchen Display System (KDS)
Lineage	Former/current documentation labels include Xenial Kitchen Management (XKM), Kitchen Management and Order Management System (OMS). Confirm portfolio boundaries.
What is supported	Kitchen displays route items to configured production stations, support destination-specific views such as drive-thru, and can provide order-ready status. Public documentation describes touchscreen and bump-bar interaction plus configurable ticket views.
McDonald's relevance	Relevant to end-to-end order flow, throughput and integration conversations—not as an assumed replacement for McDonald's kitchen production systems.
Proof point	Current Xenial documentation shows active Genius Kitchen product documentation and Xenial Kitchen release notes.
Ryan to confirm	Which KDS/OMS components are current, their external names, integration interfaces, hardware requirements, enterprise deployments and any CosMc's footprint.

Genius Back Office CONFIRM BEFORE EXTERNAL USE

Current label	Working label: Genius Back Office / enterprise reporting
Lineage	Historical labels visible in Xenial support materials: The Portal RTI, RTI Financial Accounting, Back Office and enterprise reporting.
What is supported	Public Xenial portfolio materials establish back-office and enterprise-reporting capabilities, while support materials show continuing RTI-related product families. Detailed current scope is not sufficiently clear for an external claim in this draft.
McDonald's relevance	Potentially relevant to store operations, inventory, labor, financial and enterprise reporting discussions once the current module map is confirmed.
Proof point	Xenial's current support directory still routes customers for The Portal RTI, RTI Financial Accounting and Back Office.
Ryan to confirm	Current product names and module boundaries; RTI lineage; supported functions and integrations; customer references; roadmap/status; owner and delivery coverage.

Integrated payments and gateway CONFIRM BEFORE EXTERNAL USE

Current label	Global Payments Integrated (GPI) and Portico Gateway; processor connections include Global Payments and Worldpay/Vantiv
Lineage	Working lineage: Merchantware → Cayan; the current payments deck identifies GPI and Portico. Confirm the precise brand-to-platform transition before using the lineage externally.
What is supported	One semi-integrated/API layer for counter, drive-thru, kiosk and digital commerce: EMV/contactless and wallets, card-present and online acceptance, P2PE/tokenization, hosted payment components, remote terminal management and device-based store-and-forward. Listed processor connections include Global Payments, Worldpay/Vantiv, Fiserv, Elavon and Chase.
McDonald's relevance	The McDonald's story is cross-channel orchestration, processor flexibility, centralized device control, offline resilience and token continuity—not the full feature catalog.
Proof point	CosMc's used Global Payments processing, but FreedomPay supplied the gateway because the required unattended certification was unavailable in time. This is not proof of a full GPI gateway deployment.
Ryan to confirm	Arjun/Payments: confirm names and lineage; GP versus Worldpay roles; processor/device certifications by market; unattended status; current Verifone/iMin availability; and what may be shared with Jeff.

Digital experience and drive-thru

Genius Digital Displays PUBLICLY GROUNDED

Current label	Working current label: Genius digital menu technology / digital menu screens
Lineage	SICOM DMB was first developed in 2009. After Global Payments acquired SICOM in 2018, the next-generation Genius DMB was developed as a complete replacement—not an extension of the former SICOM software.
What is supported	Public materials describe centralized/remote content management, scheduled dayparts, local and corporate control, indoor/outdoor menus, order-confirmation boards and operations monitoring. Architecture can vary by deployment.
McDonald's relevance	A credible alternative architecture to evaluate for targeted needs. Do not characterize McDonald's as replacing an incumbent or running a formal second-source process.
Proof point	Xenial reports deployment at 106 Yoshinoya locations; 34 drive-thrus combined digital menu boards and a timer, with a reported 35% service-time reduction.
Ryan to confirm	Current external name; CMS/monitoring model; supported playerless versus media-controller configurations; display/hardware partners; service coverage; CosMc's footprint; permission to use Yoshinoya details.

Genius Drive Thru PUBLICLY GROUNDED

Current label	Genius Drive Thru; current documentation includes Drive Thru Director and Vision
Lineage	SICOM Timer (1989) → rewrite (2001) → new monitor/UI solution (2014) → Drive-Thru Director with continued Genius enhancements. Vision, developed around 2022, is the 100% Genius next-generation timer.
What is supported	Current documentation describes lane event capture from loop detectors, camera systems and intelligent order-confirmation units; real-time vehicle visualization; single/dual-lane workflows; gamification; and reporting/API capabilities. Public Xenial materials also describe camera-based timing.
McDonald's relevance	Strongest near-term proof area if Product confirms what is commercially available, what was used at CosMc's and which integration/service commitments are supportable.
Proof point	Yoshinoya is the public proof point. The JPR discussion also identified CosMc's as an important internal reference, but exact scope and disclosure permission remain unverified.
Ryan to confirm	Current sellable components versus roadmap; supported sensor/camera/OCU architecture; reporting/API; AI claims; CosMc's requirements and deployed scope; customer references; install/field-service ownership.

Hold from the external version unless Ryan confirms

Claims that the system reuses existing security-camera feeds; Wi-Fi camera deployment; employee movement tracking; player-free DMB as a universal architecture; or a camera timer developed specifically for CosMc's. These may be valuable hypotheses, but they are not treated as verified capabilities here.

Recommended routing sequence for Jeff

1. Validate the map with Ryan and identify one accountable owner per category.
2. Convert this review draft into a two-page external routing sheet—current names, one-sentence capability, proven deployment and McDonald's relevance.
3. Send Jeff the approved sheet and ask him to route Digital Displays/Drive Thru first, then Payments and the broader platform only where there is a defined owner or initiative.
4. Use any Justine Power introduction as a discovery path; keep CosMc's evidence precise and avoid implying system approval.

Source notes and claim boundaries

Evidence standard

Publicly grounded does not mean customer-approved for reuse. Ryan should still confirm current availability, product naming, reference permissions and the operational delivery model before external circulation.

Internal inputs requiring confirmation

- August 11 JPR discussion with Jeff Coffland, including the requested product-lineage map and CosMc's context.
- Internal account intelligence: CosMc's footprint, hardware ownership/manufacturing, roadmap concepts, references and owners.
- Michael Schwartz product confirmation, August 11, 2026: DMB and timer lineage, Flytech manufacturing relationship, hardware ownership, Merchantware/Cayan direction and CosMc's processing/gateway architecture.
- Global Payments Integrated — Payments Overview (internal 2025 deck, received August 12, 2026): GPI/Portico architecture, channels, processor connections, terminal management, offline operation and devices. Roadmap labels and certifications require confirmation.
